Foreword

The phenomenon which I observed in the case of a subject with *Crohn's Disease* is in my opinion an example of *morphic resonance*.

The aim of this document is to present the example of this subject's *Crohn's disease* as a case study of the effect of morphic resonance on disease. .

The document consists of several sections:

Case example: *Crohn's Disease*

This section describes in detail the observed case

- Influence of the *Moon nodes*
- Influence of *Mars*
- Current results of online survey within *Crohn's Disease Forums*

Astrology:

This section checks in general if there is a correlation to *Crohn's Disease* and the Zodiac.

In addition, samples of several astrology systems were taken.

- A statistical evaluation was done with 52 test subjects suffering from *Crohn's Disease*.
- Saturn Transit was used to sample the prediction accuracy of different astrology systems.

All used astrological terms and coordinates refer to the *western tropical Zodiac*.

The given times refer to: *CET / Austria (incl. DST)*

Used coordinates of the *Moon nodes* = *true nodes*.

Note:

This document is a part of my *morphic field hypothesis*.

To understand the content of this document it is recommended to read the hypothesis: *morphic_field_hypothesis* first.

The latest version of this document can be found on my personal *directbox.com* **Cloud Drive**:

Hubert Rehberger

June 2015

Case Example: Crohn's disease

Example A: Influence of the Moon nodes

The subject (Subject 1) was born in **23 July 1971 11:45** in *Melk/Austria* and has suffered since his early youth from *Crohn's Disease* [1].

Subject 1's most painful relapses took place on the following dates :

1st Relapse: 29th January 1994 (acute) -> *northern lunar node at 0°21' Sagittarius*

2nd Relapse: 4th April 2003 (acute) -> *southern lunar node at ~0°10' Sagittarius*

3rd Relapse: 28th August 2012 (acute) -> *northern lunar node at 0°18' Sagittarius*

The first signs of deterioration began ~approximately 10 days before the acute phase, the 28th of August..

Despite this pre-phase, the acute phase itself began quite quickly and unexpectedly with no prior pain experienced by the subject,..

During the acute phase, the subject began having very severe cramps in the abdominal area and could hardly move. Additionally, the subject experienced blood pressure problems.

The complete acute phase took place until around 10 a.m. until the subject fell asleep. At approximately 1 p.m. the subject woke up and showed no sign of unwellness.

Not only the acute phase was over; the complete relapse (which showed its first symptoms ~10 days before) was over within ~3 hours. There were no noticeable after effects.

The subject could move again normally and carry out daily activities from 1 p.m. on.

Below are the Zodiac pictures of the mentioned days:

January 1994

April 2003

August 2012

Coincidence A:

The probability that a relapse like this (at 0° Sagittarius) would occur coincidentally 2x in a row is:
~ 1 to 11,000,000

Coincidence B:

The probability that a direct connection to the birth radix of the Crohn's sufferer occurs by coincidence (in this case: direct Conjunction with birth-Neptune) is:
~ 1 to 3,000,000,000

Coincidence C:

The probability that another subject (born July 1971) with *Crohn's Disease* can be found who demonstrates exactly the same time patterns by coincidence is:

>> 100 Billion

[1] incl. mild form of wheat or gluten intolerance

Further information:

Pre-Phase:

Rahu's degree range in Sagittarius where the disease showed its first symptoms until the *acute phase* began: $\sim 1^\circ - \sim 0^\circ 20' 41''$ [1]

Direct Phase:

Rahu's degree range in Sagittarius where the acute relapse in August 2012 appeared was: $\sim 0^\circ 17' 19'' - \sim 0^\circ 20' 41''$ (*acute phase* $\sim 0^\circ 18'$) [2].

Post-Phase:

Rahu's degree range in Sagittarius where the acute relapses including all noticeable symptoms [4] were over: $\sim 0^\circ 17' 19'' - \sim 0^\circ 16' 26''$ [3]

It is interesting to see that the *post-phase* is much shorter than the *pre-phase*. The *pre-phase* took place over 10 days whereas the *post-phase* was over within a couple of hours.

[1] $\sim 18.08.2012 - 27.08.2012$

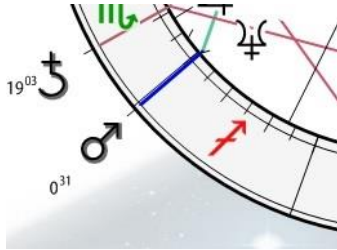

[2] $27.08.2012 \sim 10pm - 28.08.2012 \sim 10am$

[3] $28.08.2012 \sim 10am - \sim 1pm$

[4] symptoms that the observer was aware of.

Example B: Influence of Mars

During the drafting of this document, Subject 1 had another relapse on the 14th September 2014. On this relapse date, the subject indicated that their symptoms were severer than normal and lasted several hours. After consultation of the radix, the cause seemed to be Mars which was transiting by Neptune.

14.09.2014

Planet Mars was at this day around 0° until 0°50' Sagittarius.

An accident can be excluded first hand because on the next day the subject's symptoms disappeared and didn't manifest again.

Additionally:

Mars conjunctions with the Birth-Neptune showed strong influences on the person's disease on the following days:

- 06th March 2016 (~Sinusitis or inflammation of the glands)
- 26th May 2016 (~unusually free of symptoms since a couple of days – suddenly no diarrhoea anymore)

The possibility of a coincidence between the transiting Mars and his birth-Neptune (three times in a row) is: much more than 1 to 1,000.000

During a medical examination it was found that the subject's intestines were re-inflamed, therefore they were prescribed and started to take *Imurek*^[1] by the beginning of October 2014.

[1] Azathioprin

Case example: Online Survey

In September 2014 I started an online survey in several forums.

I hoped to find a person with Crohn's disease also born in *July 1971*, who could tell me whether they also experienced acute relapses in the given times or not.

There are only

~200 (Germany/Austria)

~1000 (USA)

~150 (U.K)

people who are eligible to give a clear answer to this question.

Around 1,800 people have read my question and the online survey brought up a second form of proof. One person born in June 1971 also had a relapse in 1994 and again 18 years later.

Additionally, the online survey also showed that some Crohn's Disease sufferers experienced the phenomena of periodical relapses e.g.

Once per 2 year cycle,

Twice per 6 month cycle

→ The online survey brought up some additional forms of proof. The data showed that Crohn's disease sufferers born in July 1971 in general tend to have relapses every ~18 years (Rahu cycle).

It is difficult to carry out this research anonymously in an online forum, therefore I hope that a survey among astrologers themselves can bring a clear answer to this phenomenon.

Astrology: Statistical analysis of *Crohn's Disease*

During work on this analysis, I was informed of another possible study subject suffering from Crohn's disease .

This subject's (Subject 2) birth-date is: *06.12.1967 and shows that a planet (in this case Mercury) was aligned at $\sim 1^\circ$ Sagittarius.
(Similar to the case shown above).

Another subject (Subject 3) with a similar birthdate was found.. Subject 3 was born on: *24.04.1975 and on this date a planet (Rahu) was also aligned at $\sim 1^\circ$ Sagittarius.

A similar case (*12.1942) did not suffer from Crohn's disease but had colon cancer and liver cancer. In this case a planet (Mars) was aligned at $\sim 4^\circ$ Sagittarius.

This data brought me to the idea in general to check how often a planet resides in Sagittarius when a person suffers from Crohn's Disease.

Statistical analysis - based on birth dates:

I performed an statistical analysis with ~ 52 birth dates

most birth dates were taken from Wikipedia:

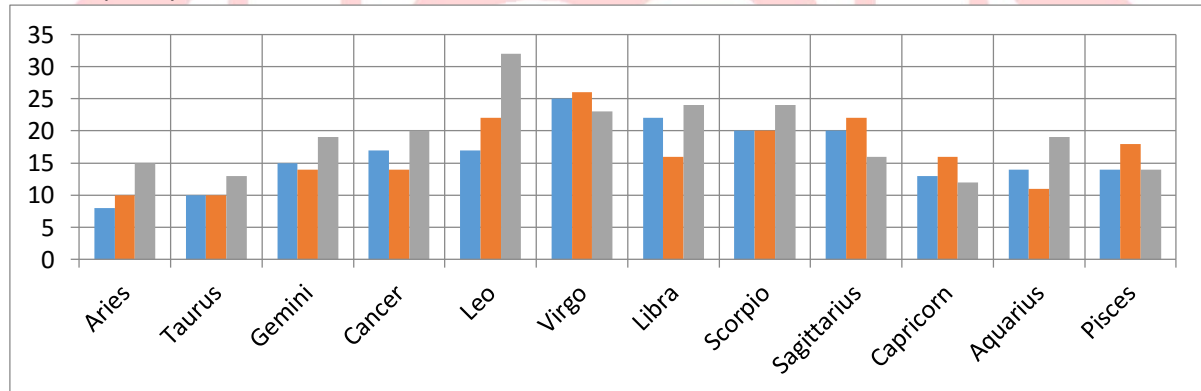

http://en.wikipedia.org/wiki/List_of_people_diagnosed_with_Crohn%27s_disease

incl. 2 famous people: Cynthia McFadden: *27.05.1956[1], Frank Fritz: *03.03.1965[2]

the rest are the 3 known cases from my circle of acquaintances mentioned above: *July.1971, 06.12.1967, 24.04.1975*

Modern Western Astrology (12 planets):

The frequency distribution of the Planets, at a resolution of 10° , is as follows:

Number of used data ~ 624 ^[3]

Linear average ~ 18

Maximum value = 32, ~ 175 [%] deviation from the linear average

Minimum value = 8, factor ~ 2.25 below the linear average

[1]source: [Wikipedia.org](http://en.wikipedia.org)

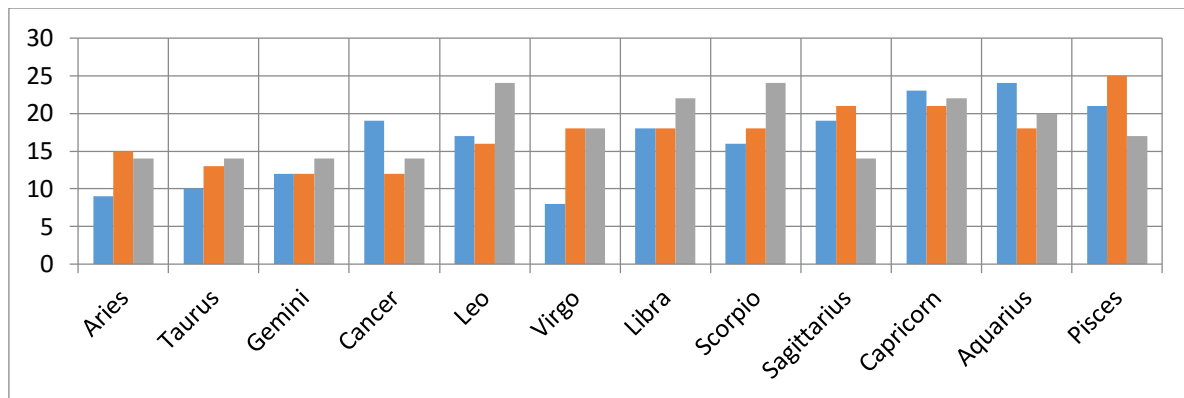

[2]source: *answers.com*

[3] total number of planetary positions = (nr of birth dates) * (nr of planets)

Cross-check with randomly created birth dates (12 planets):

(from year 1950 – 2014)

The frequency distribution of the planets, at a resolution of 10 °, is as follows:

Number of used data ~ 624_[1]

Linear average ~ 18

Maximum value = 25, ~ 138 [%] deviation from the linear average

Minimum value = 8, factor ~ 2.25 below the linear average

Evaluation:

Graph: Modern Western Astrology (12 planets)

- The range to be examined within 0°-10° Sagittarius is the only factor ~ 1.10 above the linear average, which disproves a direct correlation between the sign *Sagittarius* and *Crohn's Disease*.
- The graph shows a clear peak value at 20-30° Leo, which could confirm this hypothesis.
- The strong deviation of the maximum and minimum values from the linear average would tend to confirm this hypothesis.
- The wave form of the graph indicates a shape of a hill, where its peak is at 20-30° Leo. Since the slowly orbiting planets *Pluto* and *Neptune* cannot be held responsible for this, this preliminarily confirms this hypothesis.

Cross check with randomly created birth dates (12 planets)

- The randomly created birth dates also show a peak value at 20°-30° Leo, which is about 40% smaller than the peak in the first evaluation. These peak values (beginning with Leo, ending in Pisces) can be explained by the slowly orbiting planets *Pluto* and *Neptune*, as between 1950 and 2014 these planets were residing within these areas.
→ This preliminarily disproves b)
- The randomly created graph also shows a strong deviation of the maximum and minimum values from the linear average. This brings us to 2 conclusions:
 - 52 birth dates are too few to create a meaningful statistic and therefore
 - preliminarily disproves c)
- The shape of the randomly created graph does not show the shape of a hill. It has more the tendency of a steady increase, whereas around *Aquarius*, *Pisces* is its peak. This steady increase can be explained by slowly orbiting planets. – similar to point e)
→ This preliminarily confirms d)

[1] total number of planetary positions = (nr of birth dates) * (nr of planets)

The hill wave form provisionally supports this hypothesis, but due to the small amount of birth dates the statistics do not give a clear result so far. Thus the existence or nonexistence of a *sign quality* is not clearly verifiable. A statistical coincidence is still possible.

But during work on this hypothesis it became clear that that Crohn's Disease is quite a complex issue, whereas each individual person has their own special needs, perhaps a *sign-quality* shows its influence there. If the zodiac is really representing the *quint-circle of music*, it sooner or later must show its influence on the specific characteristics of the disease (*lactose or gluten intolerance* for example).

May 2015: Online survey:

I posted a survey question about whether *Astrology* can predict the course of chronic diseases in several alternative thought and astrology forums in order to find out how many people with chronic diseases thought that astrology was possible to estimate the course of their disease.

The number of answers was very low.

Among **~1300 possible respondents**, there were only **11** who could give an appropriate answer.

Western Astrology: **3 people** answered with **YES**. **3 people** answered with **NO**.

Vedic Astrology: **5 people** answered with **YES**. **No one** answered with **NO**.

Due to the extremely low number of participants it is not possible to use the result for an evaluation.

As far as I could gather from the very few comments I got, not many astrologers offer *medical astrology*, due to *ethical, scientific and legal* reasons. Especially in Western countries medical astrology is deliberately avoided by astrologers due to legal issues.

Astrology: Predictions of upcoming *Saturn Transit*

I used the opportunity of the upcoming Saturn Transit in Dec. 2014 to perform samples on several types of astrology in order to check which type of astrology is probably most suitable for further studies.

I contacted several astrologers from different schools in order to give me an estimation of the upcoming Saturn Transit. Mentioned below is a list of those who could give me a prediction.

One professional Vedic astrologer (Brahmin family, India)

Sun/Jupiter – period starts by the end of October and will improve health conditions.
Time from April 2015 until August will be a little bit harder again because in April there will be a lunar eclipse and in June Jupiter is changing the sign so all this can influence his health.

One professional astrologer *Huber School* (Germany)

Upcoming *Saturn Transit* is seen as bringer of health. No problems expected

One hobby astrologer *Huber School* (Switzerland)

No problems are expected by the upcoming *Saturn Transit*

One western hobby astrologer (Vienna, Placidus Houses)

Chiron (wounded healer) in 6th house means health issues are a part of life.
A significant relapse or psychosomatic deterioration is very likely. Symptoms should start to occur around 15th December.

One western professional astrologer (SFER, Switzerland, Koch Houses)

Also here Chiron indicates that health issues are part of personality development in life.
Upcoming Saturn Transit can bring relapses again, but if they occur than they are not expected to be as painful as the years before. (Not many activations). But some problems are expected next year.

One professional computer based analysis (AstroData, Switzerland)

Aspect of transiting Pluto with moon could cause problems with the *stomach, lymphs, skin and inflammations*.
Comment: Analysis itself is imprecise and in its formulation ambiguous.

One professional classic astrologer (Pegasus-Advies, Netherlands)

Only small troubles are expected in December, because Saturn is cooling Mars's influence.
But lots of problems are expected in April/May 2015.

All astrologers were informed in detail of the history of Subject 1's case , except for the computer based analysis.

Course of the relapse December 2014:

Here I will give a short overview the course of the disease for Subject 1.

On the 15th of December the subject was under observation. There were no complaints of indication of symptoms. Between 15th and 19th of December there was no contact with the subject .

On the 19th December in the afternoon (~4 p.m. until ~6 p.m.) the subject was under observation and in this period the subject complained of stronger stomach aches.

Between 19th and 24th December there was again no contact with the subject .

From the 24th December until the 29th of December the subject had no stomach aches.

From 29th December until 03rd of January there was no contact with the subject.

After December, the subject was queried further about symptoms experienced in this month. The following summary was elicited:

Except for the 19th December no symptoms were experienced. On the 19th December, symptoms began around noon and ended at ~6p.m. - ~8p.m on that day (symptoms: diarrhoea and strong stomach pains).

Course of the relapse April 2015:

The subject suffered from very strong back pain for a long time in April but had no perceivable complaints regarding *Crohn's disease*.

Result:

Saturn transit caused symptoms in the last couple of months therefore:

- *the Huber School* was definitely wrong in its predictions
- *Computer based analysis* is inadequate for health issues

However, it is not possible to clearly verify if the other astrological prediction methods are suitable to predict the course of *Crohn's Disease* or not, because of three main reasons:

- Subject 1 took *Imurek* for a couple of months which can prevent a relapse. (This is actually the intention of such a treatment).
- As a non-affected person it is quite difficult to estimate the meaning of predictions especially when the course of the disease is estimated. Example SFER Analysis: It was not clear how the astrologer estimated the severity of this Saturn Transit.
- As a non-sufferer it is not really possible to examine clearly whether or not a causal connection between the courses of the disease and astrological transits exists. For an example, see *course of the relapse April 2015*.

The question if the strong back pains are protracted symptoms from the medical treatment or not cannot be answered from my side. In addition, it would be necessary to continuously record the exact time and duration of symptoms, in order to clearly exclude a coincidence.

Résumé:

The single example of *Crohn's Disease* shows that *morphic fields* must really exist. Since a second case was also found a coincidence can definitely be excluded on my side.

Regarding: observed single case:

The example showed that,

- An influence of the *Moon nodes* and *Mars* does exist and can cause a relapse.
- The *time of birth* does have an influence throughout our whole lifetimes.

Regarding: Online Survey:

The online survey brought some additional proof. From the data, it seems that especially people with Crohn's disease born in *July 1971* in general tend to have relapses every ~18 years (Rahu cycle). Also, the phenomenon that relapses occur in regular time patterns (6 months, 2 years etc.) was observed several times. However, such phenomena remain quite rare. (~1800 read my posts)

It follows then that a relapse caused by *morphic resonance* is possibly an exception. A survey among astrologers with *Crohn's disease* could clarify how often this phenomenon occurs among sufferers, especially those born in *July 1971*.

The new medical treatment possible with *mongersen*^[5] should bring a better understanding of this phenomenon in the upcoming years, because as far as I evaluate the situation, there should remain a minority of patients in whose case this new treatment doesn't show the desired success. The influence of *morphic fields* should manifest within this minority more often than usual. The next acute relapse of Subject 1 should occur in January 2022.

Regarding: Astrology:

- Statistical analysis:

The *statistical analysis* shows a slight anomaly in the waveform among people with *Crohn's disease* which provisionally supports a serious background of astrology. But a statistical coincidence cannot be excluded so far.

For a final result more birth dates of people with *Crohn's Disease* are needed.

- Predictions:

It is not possible for me as a non-sufferer to clearly verify if astrological prediction methods are suitable to predict the course of *Crohn's Disease* or not. Additionally the online survey didn't bring much clarity to this issue.

To get a final answer on this question, in recent months I tried to organize^[6] a survey among *astrologer associations*^{[1][2][3][4]} in order to find out how often *Crohn's Disease* occurs among their members and how well they can predict the course of their own disease but all attempts to organize such a survey failed.

Therefore Astrology should not be used so far to analyse the course of *Crohn's Disease*.

[6] November 2014 – January 2015

Alternative explanations:

Some researchers believe that solar activity can trigger relapses of diseases (like *rheumatoid arthritis* e.g.):
<http://www.pppl.gov/news/2015/06/researchers-correlate-incidences-rheumatoid-arthritis-and-giant-cell-arteritis-solar>

Perhaps relapses of *Crohn's Disease* can be triggered additionally in this way, but in this specific case of *Crohn's Disease – July 1971* an influence of the sun can be definitely excluded due to several reasons:

- The solar activity does not have an exact periodicity of 9.3 years like the lunar cycles. Its periodicity lies between 10 to 13 years.
- Due to that an exact prediction of upcoming relapses is not possible.
- The solar activity also does not have an exact correlation to the birth date of a person.

If relapses of arthritis are triggered by the *lunar node cycle* or not must be checked specifically.

In this case it would be the best if astrophysicists and astrologers do research among family members or subjects that they can observe closely and constantly. A statistical analysis of such phenomena is in my opinion not meaningful, because in order to truly prove or disprove a coincidence you directly have to know the subject and their medical history.

Chronic diseases (like *arthritis, multiple sclerosis, Crohn's disease* and so on) triggered by moon nodes must show a clear pattern of 9.3 years, within an accuracy of a couple of days in order to identify a possible influence of *morphic resonance* or not.
